

Source Technologies Integrated Solutions

Enhanced output management and security for specialized print applications

Integrate and manage output from legacy systems to improve operational control and lower print delivery costs. Benefits include increased flexibility and protection for distributed printing.

LRS Enterprise Output Management and Source Technologies (ST) offer complementary solutions for specialized print management and security.

These solutions provide end-to-end protection of sensitive output. Customers can secure output for delivery from the application all the way to the printer. They use encryption technology from both LRS and Source Technologies to support ST MICR (magnetic ink character recognition) printers and non-ST production printers. Customers benefit from protection that meets AES guidelines and Federal Government encryption standards.

Using LRS® and Source Technologies integrated hardware and software solutions gives companies superior control over their financial transactions and other business processes.

Manage Distributed MICR Printing

LRS software provides solutions for transforming AFP and Xerox print

data streams to PostScript, PCL, or other compatible formats, which can then be directed to Source Technologies' desktop, workgroup, and light production MICR laser printers. With this solution, companies can securely manage distributed, on-demand printing of checks, Image Replacement Documents (IRDs), and other negotiable documents.

Manage Production MICR Printing

LRS software provides solutions for converting, managing, and delivering output to many production printers including Xerox, Océ, IBM, Canon, and Ricoh.

Source Technologies' workgroup or enterprise payment software integrates at a communications level with LRS software, enabling customers to securely print checks, IRDs, and other negotiable documents using MICR-enabled production printers.

Example: Completing transactions at remote facilities required suppliers of a large agribusiness to wait several days before receiving check payments. With thousands of checks disbursed weekly, the business incurred large

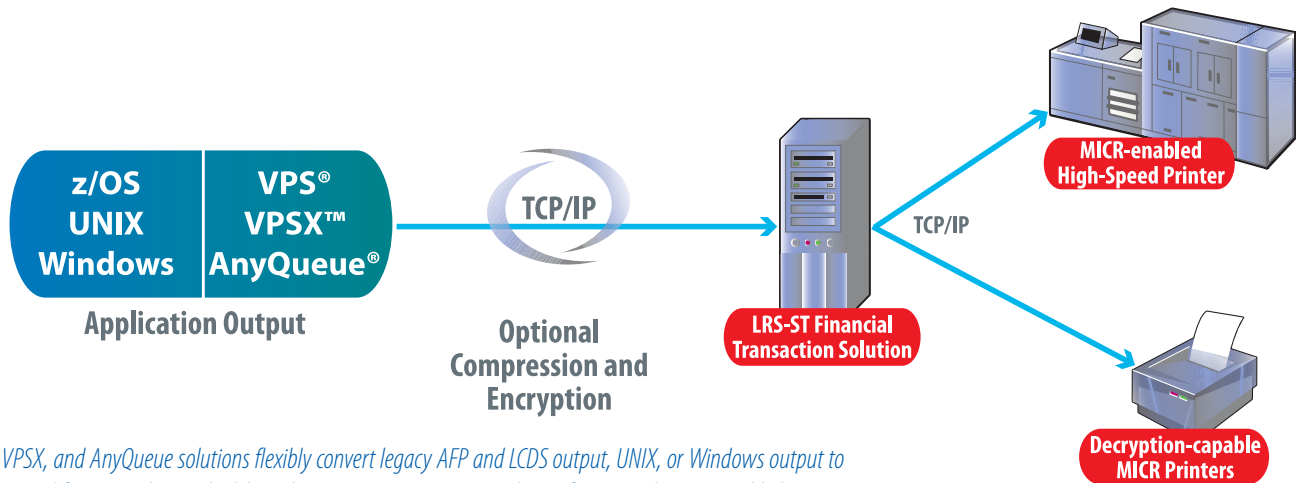

One of the largest agricultural processors in the world automated secure check disbursement to remote offices, increasing customer satisfaction and lowering cost.

manual processing and physical delivery costs.

LRS and ST enabled this customer to route their CICS output securely from z/OS to ST's Windows-based check printing system for secure check printing on ST MICR-enabled printers at remote offices, on-demand. The solution reduced potential fraud by using blank check stock in the remote offices, and provided real-time, centralized control for all remote check printers and output via a web browser.

Now this agribusiness can pay suppliers on delivery with lower costs, fewer errors, and less risk.

Source Technologies Integrated Solutions – Product Highlights

VPS, VPSX, and AnyQueue solutions flexibly convert legacy AFP and LCDS output, UNIX, or Windows output to the required format and securely deliver that output to an LRS - ST solution for use with MICR-enabled production and distributed printers.

LRS and Source Technologies solutions integrate functionalities that enhance business flexibility and processes. Communications, encryption-decryption, output management, forms management, and MICR printing work together in distributed or centralized approaches to solving specialized business needs. The majority of the Fortune 1000 companies and top banks worldwide attest to this value.

Integrated solutions capabilities:

- Secure printing to ST MICR-enabled printers using LRS Secure solutions
- Transform and deliver legacy AFPDS and LCDS output as PostScript, PCL, or PDF to ST printers
- Reduce dependency on pre-printed forms by delivering output to ST FormsPartner and CheckPartner solutions
- Enable check printing and disbursement remotely and securely at the point of request
- Print large volume check runs, generated by ST solutions, on production printers
- Provide a single point of control for all check printers and output

Application Output Management:

- LRS solutions for z/OS, UNIX, or Windows operating systems
- Manages output from a browser
- Integrates with Source Technologies' secure financial workflow solutions using AnyQueue to receive output from VPS or VPSX via direct Sockets and LRSQueue
- Supports error recovery, with optional compression and encryption

Secure Financial Workflow Solutions:

- Integrates with ST FormsPartner, CheckPartner, and eDocSecure solutions to securely receive legacy and open systems output
- Provides output management, conversion, and delivery to non-ST production and ST desktop, workgroup, and light-production MICR printers
- Enables browser-based monitor and control
- Supports encryption directly to decryption-capable ST printers
